

Filter Regulators

Modular Filter Regulators.

Built in moisture and particulate removal of up to 5 micron. Analogue type pressure gauge with locking function. Manual drain system. Provides optimal pump control and helps improve compressed air efficiency. Clean air will generally increase the pumps lifetime before service interval. Direct pressure control can also protect the pumps diaphragms from damage caused over pressurization. Replaceable filter element

FRL

Same as above plus an oiler function. Can be useful in conditions such as when using extremely dry air or when pump is operating for prolonged periods without stopping. NOTE; in normal operation YTS pumps do not require airline oil lubrication.
